Set Answer 1

Scenario Based Answer

1. Smart customer support chatbot

Logic:

- A Master Agent receives the customer's query.
- It identifies the type of request.
- It delegates the task to the appropriate specialized agent.
- FAQ Agent handles common questions.
- Ticket Agent creates support tickets.
- Escalation Agent handles complex or unresolved issues.
- The Master Agent combines the results and responds to the customer.

2. Sub-Agent fails to complete its task

Logic:

1. Master Agent detects that the Sub-Agent failed.
2. It checks the error or failure reason.
3. It retries the task if the failure is temporary.
4. If it fails again, it assigns the task to another suitable agent.
5. If no agent can complete it, it reports the failure or requests human assistance.

3. Healthcare conversational AI

Logic:

1. User enters symptoms.
2. Symptom Analysis Agent evaluates the provided symptoms.
3. Its output is passed to the Next-Step Recommendation Agent.
4. The recommendation agent suggests appropriate next steps.
5. The final response is presented to the user.

4. Agent responds slowly during real-time chat

Possible reason:

- Too many agents are executing sequentially.
- Unnecessary API calls.
- Large prompts or conversation history.
- Slow external API responses.
- Agents are waiting for one another.

Solution:

- Reduce unnecessary agent calls.
- Use parallel execution for independent tasks.
- Optimize prompts and context size.
- Use faster models where appropriate.
- Add caching for repeated queries.
- Use asynchronous execution.

5. Smart assistant expansion

Logic:

Create separate specialized agents:

- Calendar Agent – manages events and schedules.
- Email Agent – sends and manages emails.
- Reminder Agent – creates reminders.
- Weather Agent – retrieves weather information.
- Master Agent – understands the user's request and delegates tasks.

6. Agent gives generic replies and doesn't adapt to preferences

Logic:

- Store relevant user preferences.
- Maintain conversation history.
- Retrieve previous interactions when needed.
- Use stored context to personalize future responses.
- Allow users to update or delete their preferences.

7. Chatbot repeats the same answers even when context changes

Logic:

1. Check whether previous conversation messages are being passed correctly.
2. Maintain the latest conversation context.
3. Update the conversation state after every interaction.
4. Avoid using outdated cached responses.
5. Ensure the agent considers the latest user input.

8. AI agent makes decisions using financial data

Logic:

- Encrypt sensitive financial data.
- Authenticate and authorize users.
- Apply role-based access control.
- Protect data privacy.
- Validate financial information.
- Maintain audit logs of decisions.
- Include human approval for high-impact financial actions.
- Test the system for bias and incorrect decisions.

9. Travel assistant using flight, hotel, and weather data

Logic:

- Flight Agent retrieves flight information.
- Hotel Agent retrieves accommodation information.
- Weather Agent retrieves weather forecasts.
- Master Agent coordinates these agents.
- It combines the results into one travel recommendation.

10. FAQ chatbot becomes a personal assistant

Logic:

- Add a Master Agent to understand user goals.
- Add specialized agents for calendar, email, reminders, travel, and other tasks.
- Introduce long-term memory and conversation history.
- Integrate external APIs and tools.
